RESEARCH STATEMENT There are two main thrusts in my research group: evolutionary robotics and machine science.

In **evolutionary robotics**, we take a holistic approach to robotics. We teach an AI to design robots “from the ground up” to best be able to perform some desired task. The AI does so by determining where to put motors, sensors, what shape the robot should have, what materials it should constructed from, and how it should be controlled by a neural network. Only this last aspect of a robot’s design is covered by traditional AI approaches. Most recently, we have adapted this method to create the world’s first computer-designed organisms (the “xenobots”): living robots made from biological tissues, rather than technological components.

In **machine science**, we attempt to automate all aspects of the scientific method. This process usually involves five steps. **1.** A “scientist AI” generates hypotheses about how some system works (e.g. how cells communicate to stabilize after surprise). **2.** An “engineer AI” then dreams up how best to poke the system of interest, or build some interesting version of that system, to test that hypothesis (e.g. a mm-sized robot built from frog tissue). **3.** A “robot scientist” then carries out that intervention, or builds that system variant. **4.** The robot’s success or failure is fed back to the scientist AI, leading it to revise its hypothesis. **5.** This process is repeated until the AIs and robot scientist make a new discovery. Often, this discovery is different or beyond what human scientists may have been capable of imagining.
